

# paradism

## A Project for Society

[www.paradism.ca](http://www.paradism.ca)

We are rapidly approaching a Canadian society – and a world society too – in which human work will be unnecessary! We call that new society paradism.

"Paradism is the essential key to the future of humanity. And it's possible now... It can be done in a few weeks, not in a few years... just a few weeks!"- Rael

## Introduction

This document is intended primarily for politicians and the media, since the former have the power to change things and the latter to influence them. (That is, as long as they have the will to do it.)

But this text also speaks to all who know that work can soon be rapidly eliminated through science and the cutting edge technologies available today, especially robotics.

Those who become unemployed through this change need not lack for anything. Instead, they can blossom and thrive in a leisure society, where the arts, sports, mutual aid and collaboration will prevail. Robot workers will meet all material needs. That is paradism!

Those who rightly question the current functioning of our society can help bring about the profound changes essential to create the just, idyllic society just described. By actively contributing to those changes, they will be able to leave a positive heritage for the entire world.

Under the current system, a few people are using technology selfishly, impoverishing the majority (many of whom have already lost or are about to lose their jobs due to technological advances) to enrich only themselves. Technological progress is inevitable, but it should be used for the good of everyone, not just the few who currently profit from it.

Without change, humanity faces imminent worldwide, violent revolution.

In fact, the first tremors of that revolution have already occurred in several parts of the world. Young people unable to find jobs are becoming desperate. Idle and without hope, they join violent movements, go to war or jihad and aggressively compete against each other for scarce resources.

Under paradism, technology will free humans from labour. The increased productivity made possible by automation and robotics will benefit the entire community, not just a privileged few. Everyone will be on yearlong vacation and enjoy an exceptional quality of life without having to work.

Who hasn't dreamt about this heaven on Earth? Yet it's no longer a dream, since paradism is imminent! As Rael says, we can create paradism now, not later! Paradism's time has come!

But to make it reality, we need to embrace change, and we need to persuade those in power to embrace it too. Paradism is for everyone!

## Our economic system no longer works!

Canada's economic reality is more or less the same as that of other so-called "First World" countries. It's easy to see that our current economic system of capitalism isn't working. Countries must continue to borrow to pay even the interest on their accumulated debt; purchasing power continues to fall; and more and more countries are already in default of their debt payments. Meanwhile, many human job categories disappear each year in the wake of technological advances.

These four factors alone signify imminent disaster. But the solutions proposed by our governments to create economic growth belong to the past. It's a past that must be overcome, not preserved. It's time to change our paradigms about how society functions.

Yet 21st century politicians are still clinging to ineffective solutions.

For example, with the excuse that they are helping to balance government budgets, they adopt "austerity policies" that reduce or eliminate existing social services. Such policies only serve to further impoverish the communities involved without solving the problem.

To solve a problem, one must first understand its underlying cause.

Under the current system, national debts and accumulated interest continue to skyrocket and will never be repaid. Why perpetuate this nonworking system?

To stop the bleeding in Canada, the Canadian government must first return to its central bank the power of borrowing from the state without interest. It must also make other changes, both short term and long term.

The attached document contains a critical description of the current economic situation. It also provides information about advances in science and technology that can offer solutions if the government takes the necessary corrective measures in time.

**Paradism**  
For a World Without Work or Money

## The Fundamental Premises of Paradism

### 1) Liberate human beings from work.

Why continue to focus on goals of economic growth and full employment when technology offers everyone on Earth the possibility of living lives free of the obligation to work? (Under paradism, those who want to pursue effortful activities will be able to do that, but it will be out of choice, not necessity.)

Worldwide, we must ensure once and for all that human beings are no longer enslaved for work purposes or treated as subjects that can be turned into unquestioning sheep. The majority of what humans currently accomplish at work - and soon all work – will soon be done better, more efficiently, more reliably and at much lower cost, by machines and robots. In worldwide locations, robots are already producing cars using very little human labour. Toyota already has a fully automated assembly plant. Very soon, all manufacturing facilities will be fully automated.

If today's technology already makes it possible to liberate human beings from labour, it is a crime against humanity to continue keeping people under the bondage of work. In a world where work is fully automated, human beings will no longer be managed or governed by anyone else. They will be the master of their own lives and the creators of their own destinies.

Science now offers multiple solutions for replacing human labour: robotics, nano-robotics and other nanotechnologies, artificial intelligence, 3D printing and a host of other innovations that are developing rapidly. (See the document in the appendix for an overview of what already exists.)<sup>2</sup>

<sup>2</sup> See Appendix chapter 3.

## **2) Eliminate money.**

When computers and machines can meet all human needs and all desired products can be produced in abundance, money will no longer be needed. Machines capable of making any object, in any specified shape, already exist. Very soon, such machines will be able to satisfy all human requests for luxury items as well as items of necessity. And they will be able to do so almost instantly and at almost no cost.

## **3) Prioritize scientific development.**

The continuing development of nanotechnology will be one of paradism's highest priorities.

Nano-replicators and nano-robots will assemble, atom by atom, whatever humans desire. Using materials extracted directly from the air and ground, they will be able to replicate any object with ease, including food prepared from any desired recipe. Upon request, nano-replicators will also be able to synthesize any desired texture or taste. The resulting product will be either an exact copy or an improvement on the original, as specified.

Nanotechnology will also be good for the environment. We will soon be able to return most of today's farmland to its natural ecological state while reserving a smaller portion for recreational purposes. <sup>3</sup>

## **4) Give every citizen some free, quality food.**

With technology that already exists, robots could plant and harvest all fruits and vegetables on farms while we await further developments in nanotechnology. It would also be easy to program robotic vehicles to deliver that food directly to consumers after they have made their selections online.

<sup>3</sup> See Appendix, chapter3c.

## 5) Provide health care 24/7.

Very soon, humanoid robots will do medical check-ups, run analyses and perform diagnostics much more precisely and accurately than today's human health professionals are able to do. These developments are imminent! Robotic nurses already exist in Japan, and robotic surgeons are already performing operations with greater accuracy than human surgeons. What's more, they can operate 24/7. And soon we will add biological printers that can produce organs upon request that match the exact composition of our own cells!

Under paradism, every human being will get the best medical treatment available. Those who pursue scientific research will do so not as work for pay but out of personal choice, out of their passion to contribute to others' well being and the improvement of society. Scientists, artists and all others who contribute to improving the health, well being and happiness of the population will be recognized for their voluntary achievements and honoured as heroes.

Specialists in all fields will have access to all resources and to all the training they wish. For example, the latest discoveries in medications and treatments will be available to every researcher for free.

Research on stem cells will be given high priority, since it holds the promise of regenerating replacements for damaged tissues and organs. Once this technology is perfected, any malfunction or injury caused by disease, genetics or accident will be easily corrected or even prevented. The aging process will first be slowed, and then stopped altogether. Eventually it will even be reversible. At that point, we will have conquered death scientifically and have access to eternal life.

Soon, any object of daily life, from a wrench to a sport car, will be readily produced on site and for free upon request. (The technology to do this exists today; several examples are included in Chapter 3 of the Appendix, while Chapter 4 describes some of the related experiences already occurring in small and large communities.) 4

## **6) Ensure that technology benefits everyone, not just a few.**

Under paradism, resources, knowledge and technology will belong to the entire community, not to private interests. Machines and robots don't need to be paid for extraction of their needed resources or for any other work. Everything they do and everything they produce will be free to everyone.

With this reality of unlimited abundance so imminent, why try so desperately to retain and create jobs? Many of those jobs offer compensation that is barely adequate for meeting basic needs.

Why not give all work to a multitude of robots programmed to serve humanity by providing a better quality of life for every human being?

## Characteristics of paradism:

### **1. Paradism is a society that respects the environment and repairs all environmental mistakes made in the past.**

Combating pollution isn't top priority today because the goal of profit maximization still dominates decisions. It will be of great concern only when it's almost too late to repair the damage wrought by rampant pollution and other ecological blunders. Under our current economic system, we're well into the danger zone. It is almost too late.

Under paradism, the health and well being of humanity and all other life forms will be a very important priority. Resources must first go toward the full restoration of earth's natural ecosystems. Our planet must be kept clean and pleasant for the harmonious development of all forms of life here, including human beings!

Among other things, this directive signifies the need for immediate, multilateral and complete demilitarization. Worldwide, we must dismantle and prohibit all weapons designed to kill or injure humans.

We also need to control population growth so that we can achieve and maintain ecological balance. Earth's total human population must be kept at a level at which our resources and technology can ensure the well being of everyone, both now and for future generations.

In addition, to avoid living on mountains of waste, every physical object must be recyclable and (ultimately) biodegradable or reusable by nano-robots. Biotechnology must be further developed to provide all the components and materials needed to meet these stipulations. We need to achieve manufacturing processes in which all the steps are completed either biologically or through biological assimilation.

## **2. Paradism is a society that has moved beyond monetary and governmental systems.**

Our current monetary and political systems are reaching the end of the road. Both will collapse at the same time, and humanity will soon face crucial decisions. For the short to medium term, the creation of a global currency and a world government could solve our current financial crisis and other dilemmas. But a global currency and universal government are just stopgap solutions. To achieve true paradise on earth, i.e., paradism, we must make the transition to a world without money or what we presently call “government.”

During the transition period, the interim world government will not govern or lead the population, but will instead carry out "global governance." This interim body will manage money supplies (while money lasts), energy, resources, population services, recreation, and environmental/ecological restoration. It will thus manage the planet without governing the population.

## **3. Paradism is a society in which the artificial geographical constructions known as countries have been eliminated, since borders and boundaries no longer exist.**

Since there is no government, paradism is also a society without politicians. Contrary to what we've been taught, the ability to organize ourselves into a harmonious society doesn't come from the existence of a government. It comes from applying basic principles of love, compassion, cooperation and respect for each and every life form.

In fact, history tells us that peoples and governments are often in conflict. Humans yearn for freedom; it's in their nature to rebel against any authority that tries to control them or make them conform.

Therefore, to maintain harmony and social cohesion, we must abandon any idea of subjecting people to an authority. No authority can remove an individual's inherent right and responsibility to make decisions and assume all the consequences of those decisions.

## 4. Paradism is a leisure society, a paradise on Earth

Although they no longer have to work, people are never bored or inactive. By its very nature, paradism creates a multitude of meaningful activities that contribute to the happiness and fulfillment of individuals as well as to the harmony of the entire society. New and established recreational activities, sports arenas, playgrounds and amusement parks are constantly available at no cost whatsoever. And everyone can also travel as often as desired, as far as desired, to enjoy the wonders of our planet. All transportation, for any distance, is completely free.

Education of all kinds is also free and available. Every person has the time and resources to learn, practice and develop skills or knowledge in any subject area or art form. Those who like to do scientific research, or to introduce new inventions or create new art forms, are encouraged and supported.

Everyone is also encouraged to grow spiritually, in the direction of his or her own choice. The happiness and harmony of each person contributes to the welfare of the whole society in a very positive way.

Artists are continually reshaping our surroundings, rendering them ever more beautiful and challenging for all to enjoy. Since money no longer exists, art is appreciated solely for its intrinsic, subjective value. Creative works are valued strictly for the pleasure or insight they can bring to others, and those who produce them will offer them purely out of love to their friends or to the community as a whole.

People no longer have to comply with specified rules of conduct or predetermined behaviour parameters. So long as they respect the freedom and choices of others, they are free to express their potential and individuality any way they wish.

## Summary

The new technologies that will allow us to liberate ourselves and create paradism, a society of paradise on Earth, cannot be stopped.

That is indeed fortunate, for this chance to create an entirely new society for humanity has arrived just in time. With continued violence and conflict so prevalent around the world as a result of today's completely outmoded economic and governmental systems, paradism is not only inevitable but necessary for the very survival of humanity on this planet.

The time has come to adopt paradism as our new model of society!

"There is no reason to be poor with the level of technology we currently have." Rael,

# Our current social and economic system versus paradism:

The following chart compares our current situation with a potential world in which the principles and values of paradism prevail.

Current system	Paradism
Promotes ignorance and fear to benefit the minority that seeks to maximize profits.	Promotes education and seeks to maximize happiness and harmony. Everyone benefits.
Characterized by minority ownership of resources, services and manufacturing companies.	Characterized by communization of resources, services and manufacturing companies.
Wastes resources to increase economic consumption, thereby increasing production and profits.	Protects resources and the environment by producing durable items with optimized components.
Ideas and discoveries are copyrighted and priced to benefit a few individuals or companies.	Ideas and discoveries are freely dispersed for the betterment of the entire community.
A small minority enjoys abundant goods and services.	The entire community enjoys abundant goods and services.
Social injustice: increasing poverty and an ever-widening gap between rich and poor. Some citizens lack even the most basic goods and services.	Social justice: equal access by all citizens to all goods and services after a peaceful revolution that dramatically narrowed the gap between rich and poor.
New production technologies (especially robotics) mostly benefit business owners, causing higher unemployment rates and additional impoverishment.	New production technologies have freed citizens from work and provided abundant goods and services. Additional improvements benefit everyone, not just a few.
Increased gains in productivity mean more profit for the minority and less access to abundance for the community	Increased gains in productivity enrich the entire community and provide better access to the abundance of goods and services.
The wealth of the owner minority is rigorously protected.	Wealth produced by automation is distributed equably to all citizens of the community.
Capitalism's values prevail. They include competition, private property, power, and continued growth. But profit is primary.	Paradism's values prevail. They include cooperation, collaboration, sharing, caring and fairness. Happiness and harmony are primary.
The current banking system enslaves nations and impoverishes their citizens by creating debt that can never be repaid. Funding is limited to projects that increase profits for banks and other financial institutions, resource and production companies and multinational corporations.	In the transitional period between capitalism and paradism, the banking system will belong to the community. Loans of existing money will be made without interest to fund projects that improve the well being of the entire community. After full paradism is achieved, banks and money will cease to exist.
Despite astounding technological advances, private production	Collectivized production and distribution ensures the wellbeing of the entire community.
Large-scale production involves the unacceptable waste of natural resources and contributes to environmental destruction.	Cutting-edge technology, especially 3D printing and nanotechnology provides production on demand while saving natural resources and preserving the environment.of natural resources,
Scientific discoveries enrich a minority. Research that is unlikely to generate short-term profits is discouraged or terminated.	Scientific discoveries serve the entire community. Child and adult labour have vanished and everyone enjoys a high quality of life.
Developments in robotics increase productivity, thereby increasing profits for a few.	Increased productivity achieved by robotics allows access to abundance for everyone.
A wealthy minority is enriched through the labour of workers who are experiencing a steady decline in purchasing power.	Community enrichment and disappearance of the obligation to work and eventually the abolition of money
Social inequities are leading toward a major revolt by the economically deprived. By doing tedious work for low pay, the poor are modern-day slaves trapped in a flagrantly unjust societal system.	Under paradism, every human being enjoys social equity and free access to the abundance of goods and services made possible through science and technology. They enjoy the paradise Earth was meant to be.

With scientific and technological advances progressing at an exponential rate, the McKinsey Institute foresees the possible disappearance of another 140 million skilled, high-level jobs by 2025.

Computers are also continuing to evolve at previously unimaginable speed. They will soon be able to complete almost any task, improving the quality of human life in dozens of ways.

Paradism is not only a solution for a better society; it is a necessity. Human beings will have a future on this planet only if society becomes more humane by fostering cooperation rather than greed and protects the environment from further abuse.

Paradism provides the means for humanity to evolve beyond what we can imagine today. (For more details, see Appendix Chapter 3.) 6

Appendix Chapter 8 provides a phased plan for first accelerating our progress toward paradism and then implementing it. Included are guidelines for conceiving a beautiful, efficient, easily manageable and human-scale city. Taken together, the guidelines describe what the city of Montreal, Canada, could become, but they can also be applied at various levels to other cities and villages.

6. Editorial: A. I. (Artificial Intelligence) could make 140 million skilled jobs disappear around in 2025...
